

Project Summary

The purpose of this project was to understand why employees leave the company and identify the factors that have the greatest impact on employee attrition. By studying employee information such as salary, job role, work-life balance, years at the company, and overtime, patterns were identified that can help the HR team make better decisions for employee retention.

The analysis shows that employee attrition is not caused by a single reason. Instead, it is influenced by a combination of factors. Employees who frequently work overtime, earn lower salaries, and have spent fewer years in the company are more likely to leave. In addition, certain job roles, particularly Sales Representatives and Laboratory Technicians, experience higher attrition than others.

Another important finding is that salary alone is not the main reason employees resign. Workplace conditions, career growth opportunities, workload, and work-life balance also have a strong influence on an employee's decision to stay or leave. This suggests that improving the overall employee experience is just as important as offering competitive pay.

Based on these findings, the HR team should focus on employees who are at a higher risk of leaving, especially those in high-attrition departments and employees who regularly work overtime. Regular one-on-one discussions, mentoring programs for new employees, career development opportunities, and better workload management can help improve employee satisfaction and reduce turnover.

Although the prediction model provides useful insights, it should be used as a support tool rather than the only basis for HR decisions. Personal circumstances, management style, and future organizational changes cannot be fully captured by historical employee data. Therefore, these insights should be combined with employee feedback and HR experience before making important decisions.

Overall, this project provides useful information that can help the organization improve employee retention, reduce hiring costs, and build a more satisfied and stable workforce.
